

Print your name: Anup Bagali

Today's date: 10/31/19

Class period: 3

1. Earth and Moon in orbit.

2. Moon

```
#define M 7.349e+22 // kg
```

```
#define R 1.7374e+6 // m
```

```
#define V 1023.157 // m/s
```

```
double r = 3.844e8 ; // distance from Earth
```

3. Speed, okay to use uniform circular motion formula.

4. Mass does not matter until including spaceship too.

5. Radius to visualize and later if spaceship crashes.

6. Initialize $x = r$ and $v_y = V$, first quadrant.

7. Check it is correct.

8. Only then, add vehicle, must change loop code now.

9. Apollo

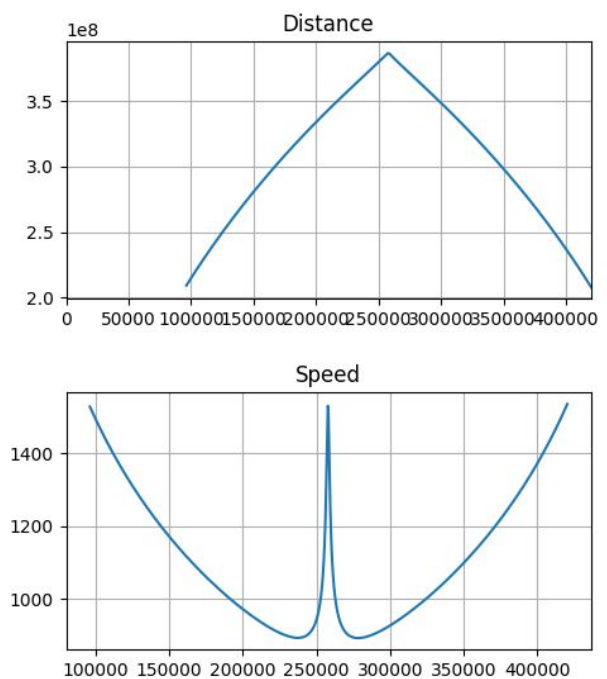

```
t[0] = 96302.0 ; // 26 h, 45 m, 2 s
```

```
r = RE + 202751774.4 ;
```

```
vmag = 1527.048 ;
```

10.

THETA = 26 degrees

-----END
